This is a wonderful, heavily illustrated synopsis of the many anatomical landmarks in cephalometry. Purpose. The purpose is to discuss cephalometry and its use in orthodontic diagnosis and treatment planning. This comprehensive review of all of the landmarks is very much needed because there are so many different cephalometric analyses and points.

Comprehensive textbook on facial development, orthodontic diagnosis and treatment planning. Includes complementary MCQs booklet and contributions from leading international experts.

An illustrated guide for the complex process of orthodontic diagnostics and indication. The total process of treatment planning including the scientific bases is pictorially described. Beside the conventional methods of examination and model analysis, emphasis is placed on the cranio-facial growth processes, the aetiology of malocclusions and on the importance of functional analysis. The following three aspects are described in detail in this book: Growth of the Facial Skeleton - types of treatment which promote or guide growth. In order to control these natural processes artificially, a precise understanding of them is required. Aetiology of the Malocclusion - the various types of causative therapy and the elimination of the causes. Functional Analysis - many malocclusions are a result of dysfunctions. As a variety of methods are available for treating dysfunctions, functional analysis is taken very seriously.

This atlas consists of 29 male and 21 female crania and is intended to serve as a reference source of documented-identity crania in the Mann-Labraxh Osteology Collection at the John A. Burns School of Medicine (JABSON) of the University of Hawaii, Manoa. It is intended to add to our knowledge of the complexity and range of cranial variation and to provide examples based on contemporary known-identity individuals. Large color photographs are provided for researchers to reference when estimating ancestry, sex, and, to a limited extent, age. This atlas increases our comparative reference samples and diversity to include individuals of Asian and Pacific Islander ancestry. Most crania in this atlas are presented using six anatomical views: anterior, right lateral, left lateral, inferior (basilar), superior, and posterior (occipital) in the Frankfort horizontal plane. A superior view of each mandible is included to provide the reader with size and shape features of the teeth and bone. Additional photos are included to highlight other features such as dental morphology and anatomical variants. Many photographs are labeled to identify specific features, while others are not, leaving interpretation to the reader. Figure captions reflect the author's opinion but are intended to allow readers to interpret features for themselves and draw their own conclusions based on the photographs of each cranium. The photographs are intended to provide readers with the most holistic and integrated perspective of each feature. Each feature is viewed as part of the whole without requiring the reader to place them along a fixed continuum or sequence based on size or shape. Photographs also allow readers to examine each feature as an integrated piece of the "puzzle."

This richly illustrated colour atlas and manual provides orthodontists, maxillofacial and plastic craniofacial surgeons, genetic dysmorphologists and medical anthropologists with exhaustive information on all aspects of three-dimensional cephalometric analysis of hard and soft tissues. The book offers practical, straightforward "step-by-step" guidance for both clinicians and researchers interested in 3-D assessment of the head and face.

Introducing the Atlas of Complex Orthodontics, a revolutionary new text with step-by-step instructions for treating today's toughest orthodontic cases. Over 1,500 full-color clinical photographs, radiographs, and illustrations present each phase of treatment in this atlas-style guide, starting with the pre-treatment work-up, continuing through the treatment sequence, and ending with the final results. Drs. Ravindra Nanda and Flavio Uribe cover the latest techniques for managing moderate to severe orthodontic problems, including the use of temporary anchorage devices and the "surgery-first" orthognathic approach, to ensure you stay ahead of the curve in the ever-changing field of orthodontics. A standardized, atlas-style presentation for each case takes you through the pre-treatment intraoral, extraoral, and smile analysis; the diagnosis and case summary (including the problem list and treatment plan); a brief discussion of the treatment options; the treatment sequence and biomechanical plan; and the final results. UNIQUE! Over 1,500 high-quality photographs, radiographs, and line drawings illustrate the stages of treatment for a wide range of complex orthodontic problems to help improve understanding. Discusses moderate to severe orthodontic problems, including: vertical problems; anterior-posterior problems; transverse problem; missing maxillary lateral incisors; impacted teeth; and surgical correction of dentofacial deformity. Multidisciplinary approach to treatment helps you draw appropriately from multiple disciplines, redefine problems outside of normal boundaries, and reach solutions based on a new understanding of complex situations. Coverage includes the "surgery-first" orthognathic approach (SFOA), a timesaving procedure in the combined orthodontic-surgical approach to selected cases of prognathism. Highly regarded lead author, Dr. Ravindra Nanda, is Chair, Department of Orthodontics at University of Connecticut and widely known in the field of orthodontics. Addresses the use of temporary anchorage devices (TADs) in correcting different types of malocclusion.

Publisher description: "The two-volume set LNCS 4190 and LNCS 4191 constitute the refereed proceedings of the 9th International Conference on Medical Image Computing and Computer-Assisted Intervention, MICCAI 2006, held in Copenhagen, Denmark in October 2006. The program committee carefully selected 39 revised full papers and 193 revised poster papers from 578 submissions for presentation in two volumes, based on a rigorous peer reviews. The first volume includes 114 contributions related to bone shape analysis, robotics and tracking, segmentation, analysis of diffusion tensor MRI, shape analysis and morphometry, stimulation and interaction, robotics and intervention, cardio-vascular applications, image analysis in oncology, brain atlases and interaction, cardiac motion analysis, clinical applications, and registration. The second volume collects 118 papers related to segmentation, validation and quantitative image analysis, brain image processing, motion in image formation, image guided clinical applications, registration, as well as brain analysis and registration."
