The warbler finch (top) boasts a thin, sharp beak best suited for spearing insects. Ground finches ' shorter, more robust beaks (center) are adapted for eating seeds found on the ground. Those of cactus finches (bottom) are shaped for getting seeds from cacti. (Harvard Medical School and Margaret Bowman)

How Darwin ' s finches got their beaks – Harvard Gazette

Some individuals are better adapted to exist in their environment than others are. ... In members of a bird species living on a remote island, the greatest number of beak variations in the population would most likely be found when ... The finch beaks had no relationship to the available food on the islands.

Beaks of Finches | Other Quiz - Quizizz

The favorable adaptations of Darwin's Finches' beaks were selected for over generations until they all branched out to make new species. These birds, although nearly identical in all other ways to mainland finches, had different beaks. Their beaks had adapted to the type of food they ate in order to fill different niches on the Galapagos Islands.
