The first truly multidisciplinary text of its kind, this book offers an original analysis of the current state of linguistic pragmatics. Cummings argues that no study of pragmatics can reasonably neglect the historical and contemporary influences on this discipline of neighboring fields of inquiry, particularly philosophy, psychology, artificial intelligence, and language pathology. By the same token, these fields can begin to address their own questions more productively by examining the insights of pragmatics. The book's range of topics and depth of analysis will be of interest to advanced undergraduate and more specialized readers in linguistics, communication studies, speech and language therapy, and cognitive science. Topics discussed include: *coverage of pragmatic concepts and theories; *criticisms of Sperber and Wilson's relevance theory, Habermas's theory of communicative competence, and Kasher's views on the modularity of pragmatics; *pragmatic deficits in a range of child and adult language disorders; and *a pragmatic analysis of argumentation in topical issues such as AIDS and BSE theories of meaning, inferences, pragmatics and AI.

The Neurobiology of Aging and Alzheimer Disease in Down Syndrome provides a multidisciplinary approach to the understanding of aging and Alzheimer disease in Down syndrome that is synergistic and focused on efforts to understand the neurobiology as it pertains to interventions that will slow or prevent disease. The book provides detailed knowledge of key molecular aspects of aging and neurodegeneration in Down Syndrome by bringing together different models of the diseases and highlighting multiple techniques. Additionally, it includes case studies and coverage of neuroimaging, neuropathological and biomarker changes associated with these cohorts. This is a must-have resource for researchers who work with or study aging and Alzheimer disease either in the general population or in people with Down syndrome, for academic and general physicians who interact with sporadic dementia patients and need more information about Down syndrome, and for new investigators to the aging and Alzheimer/Down syndrome arena. Discusses the complexities involved with aging and Alzheimer's disease in Down syndrome Summarizes the neurobiology of aging that requires management in adults with DS and leads to healthier aging and better quality of life into old age Serves as learning tool to orient researchers to the key challenges and offers insights to help establish critical areas of need for further research

It is crucial for the quality of care of people with mental retardation that care providers experience their work as meaningful. A complexity, however, is the fact that this care is divided amongst a range of professions. This book addresses issues of meaning (meaning of care and meaning of life) from all the different professional perspectives involved. Such a multidisciplinary approach is unique and has never before been followed. The book contains the results of a series of interviews in which parents of people with mental retardation were asked what they conceive to be meaningful care. The results are placed in relation to experiences and conceptions of professional caregivers. Moreover, the study analyzes the cultural, philosophical, and theological significance of the concept, "meaningful care". Finally, the book explores the relevance of this concept for practical professions such as medical care, social work, educational psychology, pedagogic counseling, and pastoral care. Scholarly depth is combined with experiential knowledge of professional practice. Hence, this book is an outstanding source of reflection for all those who work professionally with people with mental retardation.

When we worked on Down Syndrome brain in the past we have been focusing on adult brain. This was a major step forwards as most work on Down Syndrome was carried out on fibroblasts or other tissues and, moreover, we introduced proteomics to identify and quantify brain protein expression. We considered evaluation of brain protein expression in Down Syndrome brain by and by more important than gene hunting at the nucleic acid level realiz ing the long unpredictable way from RNA to protein. The availability of fetal samples along with the proteomic approach stimulated and reinforced studies on Down Syndrome brain. And indeed, it was found out that some observations on aberrant protein expression in adult Down Syndrome brain could not be verified in the fetal samples indicating that neurodegeneration in adult Down Syndrome brain may have been responsible rather than trisomy 21. Using brains from the early second trimester of gestation led to the generation of a series of clues for the understanding of aberrant wiring of the brain in Down Syndrome and enabled the determination of altered key functions in early life; e. g. undetectably low drebrin was observed in Down Syndrome cortex, an integral constituent and marker for dendritic spines, main effectors of cross-talk between neurons. In addition, evaluation of the nature of the neuronal deficits in terms of neuro transmission markers could be established as well as neuronal density in fetal Down Syndrome cortex.

Down syndrome (DS) is the most common example of neurogenetic aneuploid disorder leading to mental retardation. In most cases, DS results from an extra copy of chromosome 21 (HSA21) producing deregulated gene expression in brain that gives raise to subnormal intellectual functioning. The topic of this volume is of broad interest for the neuroscience community, because it tackles the concept of neurogenomics, that is, how the genome as a whole contributes to a neurodevelopmental cognitive disorders, such as DS, and thus to the development, structure and function of the nervous system. This volume of Progress in Brain Research discusses comparative genomics, gene expression atlases of the brain, network genetics, engineered mouse models and applications to human and mouse behavioral and cognitive phenotypes. It brings together scientists of diverse backgrounds, by facilitating the integration of research directed at different levels of biological organization, and by highlighting translational research and the application of the existing scientific knowledge to develop improved DS treatments and cures. Leading authors review the state-of-the-art in their field of investigation and provide their views and perspectives for future research Chapters are extensively referenced to provide readers with a comprehensive list of resources on the topics covered All chapters include comprehensive background information and are written in a clear form that is also accessible to the non-specialist

People with Down syndrome can do a lot; this is the reality. We will share with you, in this book, stories from people with Down syndrome who have excelled in many areas and live lives like many other people who do not have Down syndrome. We will also share with you stories about those with Down syndrome who have had medical problems and issues to deal with, yet give joy to those they come in contact with. -- Preface.
