incompressible flow near the side edge of a finite flat plate at zero incidence is reported for the Reynolds number range 10^4 to 10^6 , but comparison with data already published shows that the conclusions are quantitatively valid for Reynolds numbers up to 10^9 . The flow past a flat plate at Reynolds numbers in the range 0.1 to 10.0 is

investigated by an analogue method. The solution gives the stream function and the vorticity in the flow field surrounding the plate. From these are obtained the local coefficient of friction, the pressure distribution along the plate, and the total drag coefficient.

The numerical computation confirms the finding obtained in our previous experiments that vortex shedding from flat plates with square leading and trailing edges is caused by the impinging-shear-layer instability. In particular, the Strouhal number based on the plate's chord increases stepwise with increasing d / h in

Abstract The vortex force is studied for a flat plate at arbitrarily large angle of attack. A suitable vortex force approach,
