La aritm é tica que utilizamos en nuestros cursos de Álgebra o C á lculo es distinta de la que realiza una computadora o una calculadora. En nuestro mundo matem á tico tradicional se permiten n ú meros con una cantidad infinita de cifras. Como consecuencia de esto existen diferencias entre los resultados obtenidos experimentalmente y los emanados propiamente del modelo matem á tico.

Challenging Fronteras reflects an important new wave of research that moves beyond sweeping generalizations that treat Latinos as a monolithic cultural group. This anthology focuses on the diversity of Latino experiences by providing historical specificity and cutting-edge research that employs the conceptual and analytical tools of social science. Contributors, selected from leading researchers in Latino Studies, include Patricia Zavella, Suzanne Oboler, Alejandro Portes, Clara Rodríguez, Marta Tienda, Nestor Rodríguez, and others.

On October 14-19, 1990, the 6th International Conference on the Conservation of Earthen Architecture was held in Las Cruces, New Mexico. Sponsored by the GCI, the Museum of New Mexico State Monuments, ICCROM, CRATerre-EAG, and the National Park Service, under the aegis of US/ICOMOS, the event was organized to promote the exchange of ideas, techniques, and research findings on the conservation of earthen architecture. Presentations at the conference covered a diversity of subjects, including the historic traditions of earthen architecture, conservation and restoration, site preservation, studies in consolidation and seismic mitigation, and examinations of moisture problems, clay chemistry, and microstructures. In discussions that focused on the future, the application of modern technologies and materials to site conservation was urged, as was using scientific knowledge of existing structures in the creation of new, low-cost, earthen architecture housing.

This book is a biography of a Chilean Jesuit, Juan Ignacio Molina (1740-1829), a historian and naturalist, who wrote the Stória Naturale del Chili (1782) and the Stória Civile del Chili (1787). Before his death at the age of eighty-nine, he had spent most of his life in Bologna, Italy, as a result of the expulsion of the Jesuits from the Spanish Empire in 1767. Molina was also an ardent defender of the Americas against the false diatribes by writers such as Corneille de Pauw and William Robertson.

With contributions from 35 leading economists, this forward-looking book explores the future of development economics against the background of the past half-century of development thought and practice. Outstanding representatives of the past two generations of development economists assess development thinking at the turn of the century and look to the unsettled questions confronting the next generation. The volume offers a thorough analysis of the broad range of issues involved in development economics, and it is especially timely in its critique of what is needed in development theory and policy to reduce poverty. An overriding issue is whether in the future 'development economics' is to be regarded simply as applied economics or whether the nature and scope of development economics will constitute a need for a special development theory to supplement general economic theory.'Frontiers of Development Economics' is an ideal reference for all those working in the international development community.

A blind girl and a unicorn in a world where magic and reality merge together. Can Laura save the Wild Ones and take them to the safety of the Bright Wilderness?

Views from one of the most original cultural critics of the twentieth century, Walter Benjamin

This work by Pierre Bourdieu develops the anthropological theory which has formed the basis of his scientific research. It discusses the problems posed by "structuralist" philosophers in order to solve or dissolve them.

Kosik writes that the history of a text is in a certain sense the history of its interpretations. In the fifteen years that have passed since the fust (Czech) edition of his Dialectics of the Concrete, this book has been widely read and interpreted throughout Europe, in diverse centers of scholarship as well as in private studies. A faithful English language edition is long overdue. This publication of Kosik's work will surely provoke a range of new interpretations. For its theme is the characterization of science and of rationality in the context of the social roots of science and the social critique which an appropriately rational science should afford. Kosik's question is: How shall Karl Marx's understanding of science itself be understood? And how can it be further developed? In his treatment of the question of scientific rationality, Kosik drives bluntly into the issues of gravest human concern, not the least of which is how to avoid the pseudo-concrete, the pseudo-scientific, the pseudo-rational, the pseudo historical. Starting with Marx's methodological approach, of "ascending from the abstract to the concrete", Kosik develops a critique of positivism, of phenomenalist empiricism, and of "metaphysical" rationalism, counter posing them to "dialectical rationalism". He takes the category of the concrete in the dialectical sense of that which comes to be known by the active transformation of nature and society by human purposive activity.
